Department of Computer Science

Term Project Proposal, Fall 2023-24

Course	CSC 2108 - Introduction To Database [Section: **F**]	Group	**1**

Group Members:

Student ID	Name	Contribution
22-48505-3	MD. Wahiduzzaman Khan Dip	30%
22-48930-3	MD. Khalid Hasan	30%
22-48345-3	MD. AL Faysal	20%
22-49753-3	Estiak Rahman Ayon	20%

Project Title:

Tourism Management System

Project Description:

INTRODUCTION:

Organizing travel plans has grown more difficult in the fast-paced world of today. Our project is based on a tourism management system that aims to establish a comprehensive and efficient solution for managing travel arrangements. This project aims to simplify the process of storing and retrieving important travel-related data, including reservations for flights, hotel booking, meals, and other accommodations, by building a centralized database. By successfully implementing this project, the travel industry can benefit from improved efficiency and seamless travel experience for both travel agencies and individual users.

CASE STUDY:

In a tourism management system, a travel agency employs several employees to handle various tasks. Various types of employees work for a travel agency**. A travel agency** usually contains an agency ID, name, address, phone number, and email address. On the other hand, an **employee** has an employee ID, name, date of birth, job type, salary, and different skills. Customers can approach a travel agency. A travel agency services many customers. A **customer** registers with a customer ID, name, address, phone number, email, and membership level. All kinds of addresses are composed of city, country, and zip code. A customer makes payments for various facilities. A **payment** process may include Pay ID, amount, date, etc. A customer takes flights for traveling. A **flight** includes flight number, airline, departure and arrival which is composed by country and time. A customer uses various types of local transportation**.** Local **transportation** generally has a transport number, booking date, pick-up location, drop-in location, and mode of transport. Customers make reservations at hotels. On the other hand, A **hotel** offers accommodations to the customers and the customer gets accommodations. To make **accommodations**, there is an accommodation ID, in date, out date, room type and room number. A hotel manages food booking. Different types of food bookings are offered by a hotel. **Food booking** is maintained by booking ID, booking date, meal type, and total number of guests. **In total, there are 9 entities in the project.**
